

### Highly Variable Soil Moisture Cycle

As you irrigate on a regular schedule, soil moisture is constantly elevated and then depleted by gravity and evaporation. This causes an unstable cycle of wet and dry conditions. This instability is a challenge as it keeps the professional chasing a moving target in terms of achieving and maintain the ideal moistures level in the soil that could keep plants healthy and avoid stress and disease.

### Consistent Soil Moisture Levels with Moisture Manager

In the face of more stringent watering restrictions, you can confidently reduce your irrigation schedule without putting your greenery at risk. LESCO's Moisture Manager supplements regular irrigation by capturing moisture vapor lost to evaporation and maintaining soil wettability between waterings and rainfall. This helps soils avoid becoming hydrophobic allowing them to readily accept water when it becomes available
